

STORYLINE STORYBOARD — AS BUILT

Think Before You Click: Spotting Phishing Emails

13 Slides | Articulate Storyline 360 | July 2026 | Trina

This storyboard details every slide as built, including on-screen text, narration scripts, visual design, interactions, triggers, layers, states, and navigation logic. Slides 8 and 9 reflect updates made after initial build/testing (marked *Updated*).

3. Development — Detailed Storyboard

The storyboard below covers 13 slides, sequenced to move learners from a relatable hook through content, guided practice, a decision-making scenario, and a graded assessment. Slide 12 (Final Assessment) represents a block of 5–7 native Storyline graded question slides; the individual questions, answers, and feedback for that block are detailed separately in Section 6 (Final Assessment) to avoid repeating the same template 7 times.

Every slide entry below includes everything needed to build it directly in Storyline: on-screen text, visual description, the specific interaction type, layers, variables (kept minimal by design), triggers, states, feedback text, and navigation logic.

Slide 1: Welcome

Learning Objective	Orient the learner; establish tone and relevance.
On-Screen Text	Think Before You Click: Spotting Phishing Emails A short course to help you spot — and stop — phishing attempts before they cause harm. [Start Course] button
Narration Script	Welcome. Every day, employees like you receive emails designed to trick you into clicking, downloading, or handing over information. This short course will help you spot them before they cause harm.
Visual Design	Full-bleed navy background (#1B3A5C). Large title in white, teal accent underline. Subtle background graphic: a stylised envelope icon with a faint warning triangle overlapping the corner, low opacity, right side of screen. Off-white "Start Course" button, teal on hover.

Icons / Illustrations	Envelope icon; warning triangle icon (both flat-style, single colour).
• *Interaction Type**	Single button click (Start Course).
Layers	Base layer only.
• *Variables**	None.
Triggers	Click "Start Course" button → Jump to Slide 2, on Timeline Start of that slide reset any prior visited states (not required here, first slide).
States	Button: Normal / Hover / Visited (default Storyline button states).
Feedback Messages	Not applicable.
Navigation	Next button hidden on this slide (title slide); learner proceeds only via "Start Course" button.

Slide 2: Meet Alex: A Close Call

Learning Objective	Establish relevance and motivation before content is introduced (hook).
On-Screen Text	It's 9:04 AM. Alex, a new hire in Finance, opens an email marked "URGENT: Invoice Payment Overdue." The sender looks like their manager. There's a link to "resolve immediately." Alex's cursor hovers over the link... What would you do? [Continue] button
Narration Script	Meet Alex — a new employee, just like you might be. It's a normal Tuesday morning until this email shows up. It looks urgent. It looks like it's from their manager. Alex's cursor is hovering right over the link. By the end of this course, you'll know exactly what Alex should do next — and so will you.
Visual Design	Split-screen layout: left side shows a simplified email client

mock-up (browser-style window chrome, subject line, sender name "J. Whitfield - Manager" with a slightly-off email domain visible in small grey text). Right side shows the narrative text on off-white background. Red accent on the word "URGENT" in the mock email to draw the eye without giving away the answer yet.

Icons / Illustrations

Simple flat avatar/silhouette icon for Alex; cursor icon hovering near a hyperlink; email client mock-up graphic.

- *Interaction Type**

None (narrative/motivational slide) — single Continue button.

Layers

Base layer only.

- *Variables**

None.

Triggers

Click "Continue" → Next Slide.

States

Continue button: Normal / Hover.

Feedback

Not applicable.

Messages

Navigation

Standard Next button enabled; Back disabled (first content slide).

Slide 3: What You'll Learn

Learning Objective

Communicate course objectives and orient the learner to navigation before content begins.

On-Screen Text

By the end of this course, you will be able to:

1. Identify common signs of phishing emails
2. Distinguish legitimate emails from phishing attempts
3. Decide on the safest action when you receive a suspicious email
4. Report phishing attempts correctly

Use the Next and Back buttons at the bottom of the screen to move through the course. Your progress is saved automatically.

Narration Script	Here's what you'll walk away with: you'll be able to spot the warning signs of phishing, tell a real email from a fake one, know the safest thing to do when something looks off, and report it the right way. Let's get started.
Visual Design	Off-white background. Four objectives presented as a vertical checklist with numbered circular badges in teal. Small navigation diagram in bottom corner showing Back/Next button icons with a one-line caption, styled as a soft callout box.
Icons / Illustrations	Checklist/target icon per objective (magnifying glass, comparison/scales, shield-check, flag/report icon) — one distinct icon per objective for visual scannability.
*Interaction Type**	Click-to-reveal (optional): each objective fades/slides in on a timed sequence, or all four visible at once — beginner-friendly choice is to keep all four visible on Timeline Start with a simple entrance animation, no interactivity required.
Layers	Base layer only.
*Variables**	None.
Triggers	Timeline Start → objectives animate in sequence (Wipe or Fly In, built-in Storyline animation, no trigger needed if using entrance animations on the Animations tab).
States	Not applicable.
Feedback Messages	Not applicable.
Navigation	Standard Next/Back enabled.

Slide 4: What Is Phishing?

Learning Objective	Objective 1 — Identify common signs of phishing emails (foundational definition).
On-Screen Text	Phishing is a scam where someone pretends to be a trustworthy source — a colleague, a bank, an IT department — to trick you into clicking a link, downloading a file, or giving up sensitive information.
	Click each card to learn more:

[Card 1] What it looks like

[Card 2] Why it works

[Card 3] Who gets targeted

Narration Script	Phishing is simply a scam dressed up to look trustworthy. Click each card to see what it looks like, why it works so well, and who's actually being targeted — hint: it's not just executives.
Visual Design	Off-white background, three equal-width flat cards in a row, teal border, envelope watermark icon behind the definition text at the top. On click, each card flips or expands downward to reveal 2–3 lines of detail; unclicked cards show only a title and icon.
Icons / Illustrations	Card 1: disguised-envelope icon. Card 2: brain/psychology icon (representing urgency & trust exploitation). Card 3: people/group icon.
Interaction Type**	Click-to-reveal (3 click boxes / markers, beginner-friendly — use Storyline's built-in "Marker" or simple button+layer approach).
Layers	3 layers: "Looks Like", "Why It Works", "Who's Targeted" — each layer is a simple text panel that appears over/beside its card.
Variables**	None required. (Optional stretch: True/False variables per card to visually mark "visited" using built-in Visited state — no custom variable needed since Storyline states handle this natively.)
Triggers	Click Card 1 → Show Layer "Looks Like" (Layer property: hide other layers). Click Card 2 → Show Layer "Why It Works". Click Card 3 → Show Layer "Who's Targeted". Click "X" or outside layer → Hide layer, return to base.
States	Each card: Normal / Hover / Visited (Visited state applied automatically once its layer has been shown — set via "Change state of [Card] to Visited" trigger on the Show Layer action).
Feedback Messages	Not applicable (informational content, no right/wrong answer).
Navigation	Standard Next/Back enabled — do not require all 3 cards visited to proceed, to keep this beginner-safe (avoids complex

conditional trigger logic); Next is always available.

Slide 5: Anatomy of a Phishing Email

Learning Objective	Objective 1 — Identify common signs of phishing emails.
On-Screen Text	This email has five warning signs. Click each numbered marker to find out what's wrong. [Mock email graphic with 5 numbered hotspot markers placed on: sender address, greeting, urgency phrase, suspicious link, generic signature]
Narration Script	Here's a realistic phishing email. It's got five giveaways hiding in plain sight. Click each number to find them, one at a time.
Visual Design	Large, realistic email client mock-up filling most of the slide (browser-chrome style window). Five small circular numbered markers (1–5) in gold, placed directly on the relevant part of the email image. Off-white background outside the mock-up.
Icons / Illustrations	Numbered circular hotspot markers (Storyline's built-in Marker feature); magnifying glass icon in the instructions line.
Interaction Type**	Hotspot / marker click-to-reveal (5 markers).
Layers	5 layers, one per marker, each a short callout box: 1) "Sender address doesn't match the real domain" 2) "Generic greeting — 'Dear Employee' instead of your name" 3) "Manufactured urgency — 'act within 2 hours'" 4) "Link text says one thing, but the actual URL (shown on hover) goes somewhere else" 5) "No personalised signature or direct phone extension".
Variables**	None required.
Triggers	Click Marker 1–5 → Show corresponding Layer (hide other layers, hide base layer objects not needed). Marker state changes to Visited on click.
States	Each marker: Normal / Hover / Visited. Optional: small checkmark icon appears next to marker once Visited (achieved via state change, not variables).

Feedback Messages	Not applicable (exploratory content).
Navigation	Standard Next/Back enabled at all times; a small text cue ("3 of 5 explored") is a nice-to-have stretch goal but not required for the trial build — skip if time-constrained.

Slide 6: Four Common Phishing Tactics

Learning Objective	Objective 1 — Identify common signs of phishing emails (tactics/patterns, not just visual cues).
On-Screen Text	Phishing emails tend to use the same handful of tricks. Select each tab to see a real-world example. Tabs: [Urgency] [Authority] [Fear] [Curiosity]
Narration Script	Most phishing emails rely on one of four psychological tricks: urgency, authority, fear, or curiosity. Click through each tab to see what that looks like in practice.
Visual Design	Four horizontal tab buttons across the top, teal when active, grey when inactive. Content panel below shows a short definition plus a one-line realistic example email subject line for that tactic, styled as a small email-subject chip.
Icons / Illustrations	Urgency: clock icon. Authority: badge/briefcase icon. Fear: warning triangle icon. Curiosity: question-mark/gift icon.
*Interaction Type**	Tabs interaction (4 tabs).
Layers	4 layers, one per tab: Urgency ("Your account will be suspended in 1 hour"), Authority ("Message from the CEO — action required"), Fear ("Unusual sign-in attempt detected on your account"), Curiosity ("You've received a shared document").
*Variables**	None required.
Triggers	Click each Tab button → Show corresponding Layer, hide other layers. Timeline Start of slide → Show "Urgency" layer by default so the panel is never empty.
States	Tab buttons: Normal / Hover / Selected (Selected = active tab,

	set via "Change state to Selected" trigger, and "Change state of other tabs to Normal").
Feedback Messages	Not applicable.
Navigation	Standard Next/Back enabled; tabs do not gate progression.

Slide 7: Spot the Difference: Legitimate vs Phishing

Learning Objective	Objective 2 — Distinguish legitimate emails from phishing attempts.
On-Screen Text	Hover over each highlighted area to compare a real IT email with a phishing look-alike. [Two side-by-side email mock-ups: "Real" (left, green header) and "Fake" (right, red header)]
Narration Script	Here are two emails side by side — one real, one fake. Hover over the highlighted spots to see exactly what gives the fake one away.
Visual Design	Two email mock-ups side by side, clearly labelled with a small green "Verified" badge on the left and a small red "Phishing" badge on the right (badges shown only after interaction begins, to avoid giving away the answer before exploration — or shown from the start on this comparison slide, since the objective here is contrast, not testing). Matching highlighted regions on both (sender line, link, signature) that respond to hover.
Icons / Illustrations	Green checkmark badge; red X badge; magnifying-glass cursor icon near hover zones.
• *Interaction Type**	Hover states (3 paired hover zones: sender, link, signature).
Layers	No layers required — use hover-triggered States directly on small caption text boxes placed near each zone (simpler for a beginner than layers): captions are hidden by default (Normal state = hidden/transparent) and become visible on Hover state of the highlighted region.
• *Variables**	None.

Triggers	Hover over Sender zone (Real) → Show caption "Matches company domain exactly." Hover over Sender zone (Fake) → Show caption "Domain is misspelled: compnay-it.com." (Repeat pattern for Link and Signature zones, 6 hover triggers total.)
States	Each hover zone: Normal / Hover (built-in states); caption text boxes: Normal (hidden) / Hover-triggered visible via a simple "Show" animation or state change.
Feedback Messages	Not applicable (comparison/exploration content).
Navigation	Standard Next/Back enabled.

Slide 8: Quick Check: True or False

Learning Objective	Objectives 1 & 2 — formative, ungraded check of recognition skills before the scored assessment.
On-Screen Text	Quick check — this doesn't count toward your score. Mark each statement True or False. 1. A phishing email always contains spelling mistakes. 2. Hovering over a link can show you where it really goes. 3. If an email looks urgent, it's safer to act quickly. [True] [False] buttons per statement
Narration Script	Let's do a quick, ungraded check. Read each statement and decide: true or false?
Visual Design	Off-white background, three statements stacked vertically, each with two small pill-shaped buttons (True/False) beside it. A "Practice — not scored" ribbon in the top corner in teal to set low-stakes expectations.
Icons / Illustrations	Simple check/cross icon revealed after each answer; ribbon/badge icon for "practice" label.
• *Interaction Type**	3 simple True/False button interactions (built with buttons + states, not Storyline's graded quiz feature, since this is ungraded practice).
Layers	(Updated) 2 layers total — Incorrect Feedback layers for Statements 1 and 3 only. No layer is needed for Statement 2,

- ***Variables**** since the state change alone provides sufficient confirmation. None required — each button independently triggers its own feedback layer; no need to track a running score for an ungraded slide.

Triggers	<i>(Updated)</i> Click False (Statement 1) → Change state of button to Selected-Correct (green outline). Click True (Statement 1) → Change state of button to Selected-Incorrect (red outline) AND Show Layer "Feedback 1" to explain the misconception. Click True (Statement 2) → Change state of button to Selected-Correct (green outline). Click False (Statement 2) → Change state of button to Selected-Incorrect (red outline) — state change alone is sufficient here, no feedback layer needed. Click False (Statement 3) → Change state of button to Selected-Correct (green outline). Click True (Statement 3) → Change state of button to Selected-Incorrect (red outline) AND Show Layer "Feedback 3" to explain the misconception.
States	<i>(Updated)</i> True/False buttons: Normal / Hover / Selected-Correct (custom state, green outline) / Selected-Incorrect (custom state, red outline).
Feedback Messages	Statement 1 (False): "Not quite — many phishing emails today are well-written and error-free. Don't rely on spelling alone." Statement 2 (True): "Correct — hovering (without clicking) shows the real destination URL at the bottom of your screen." Statement 3 (False): "Careful — urgency is a manipulation tactic. Slow down and verify before acting, especially on urgent requests."
Navigation	Standard Next/Back enabled; all three are optional to attempt before proceeding (kept ungated for a beginner-friendly build).

Slide 9: Scenario Activity — Your Inbox

Learning Objective	Objectives 2 & 3 — Distinguish legitimate emails from phishing attempts; decide on the safest action.
On-Screen Text	You're back at your desk. Four new emails just came in. Open each one, then decide: Safe, Suspicious, or Phishing? [Inbox list of 4 emails, click to open each]

Email 1: "IT Support" — Password expiring notice

Email 2: "Priya Sharma (Teammate)" — Shared project file

Email 3: "Finance Dept — URGENT" — Unpaid invoice, click to settle

Email 4: "Amazon Order Confirmation" — unexpected order confirmation with attachment

[Safe] [Suspicious] [Phishing] buttons appear once an email is opened

**Narration
Script**

You're back at Alex's desk — except now it's your inbox. Four emails have come in. Open each one, read it carefully, and decide what you'd do: is it safe, suspicious, or phishing?

Visual Design

Full-screen inbox mock-up (browser-chrome window) listing 4 emails on the left, similar to Slide 2's style for visual continuity. Clicking an email opens it in a reading-pane layer on the right, styled exactly like a real corporate inbox. Three decision buttons (Safe = green, Suspicious = gold, Phishing = red) appear below the open email, consistent with the palette defined in Section 2.

Icons / Illustrations

Envelope icons for unread/read state in the list; green shield (Safe), amber warning (Suspicious), red flag (Phishing) icons on the decision buttons.

- *Interaction Type**

Multi-step scenario built from click + layers (4 emails × open state + 3-choice decision each = a lightweight branching interaction, no variables required).

Layers

8 layers total: 4 "Email Open" layers (one per email, showing full email content + the 3 decision buttons) and 4 "Feedback" layers (one per email, shown after a decision is made, explaining the correct classification regardless of which button the learner picked).

- *Variables**

None required for the core build. (Optional stretch, only if time allows: one numeric variable "ScenarioScore" that adds 1 per correct decision, displayed on the Summary slide — clearly optional, skip if it threatens the 8–10 hour budget.)

Triggers

(Updated) Click Email 1 row → Show Layer "Email 1 | Open". Inside that layer: Click | [Safe]/[Suspicious]/[Phishing] → Show

Layer | "Email 1 Feedback". Feedback layer "Continue" button → Hide all layers, change Email 1 row state to | Visited. Repeat identical pattern for Emails 2–4. When the Visited state of Email 1, Email 2, Email 3, | and Email 4 are all True → Change state of the | on-screen `Continue` button to Normal | (visible/active). |

States

Each inbox row: Normal / Hover / Visited (turns from bold/unread to regular/read once opened — standard email-list convention learners already recognise).

Feedback Messages

Email 1 (IT Support password notice — correct answer: Suspicious): "This one's Suspicious, not necessarily phishing. The sender looks legitimate, but the link bypasses your normal password-reset page. When in doubt, go directly to the IT portal yourself instead of clicking the link." Email 2 (Priya Sharma shared file — correct answer: Safe): "This one's Safe. It's from a known colleague, references a real, expected project, and the link preview matches your company's file-sharing domain." Email 3 (Finance urgent invoice — correct answer: Phishing): "This is Phishing. Notice the urgency ("URGENT"), the generic greeting, and a sender domain that's almost — but not exactly — your company's domain. Do not click; report it." Email 4 (unexpected Amazon order with attachment — correct answer: Phishing): "This is Phishing. You didn't place this order, it includes an unexpected attachment, and legitimate shipping confirmations never ask you to open an attachment to "view your invoice." Report and delete."

Navigation

(Updated) Standard player Next/Back buttons are | disabled on this slide. Progression is strictly gated | via the custom on-screen `Continue` button, which | only becomes available once the learner has explored | all 4 inbox items — a firmer gate than originally planned, chosen to guarantee learners see all four classifications before moving on.

Slide 10: What To Do When You Spot Phishing

Learning Objective

Objective 3 — Decide on the safest action when receiving a suspicious email.

On-Screen

When something looks off, here's what to do — and what to

Text	avoid. Click each column to reveal the list. [DO] column [DON'T] column
Narration Script	Once you suspect an email is phishing, here's your simple rule of thumb: a short list of what to do, and what to avoid.
Visual Design	Two-column layout, green-tinted panel on the left headed "DO", red-tinted panel on the right headed "DON'T". Each column reveals its list items one at a time on click, using a simple checklist reveal.
Icons / Illustrations	Green checkmark icons for each DO item; red X icons for each DON'T item.
*Interaction Type**	Click-to-reveal (2 click zones, one per column, each revealing a stacked list).
Layers	No layers required — simplest beginner build: list items are placed on the base layer with a "Hidden" initial state, and a single click trigger changes their state to "Normal" (visible) to reveal the full list at once per column; alternatively, reveal items one at a time using entrance animations triggered on click of the column header.
*Variables**	None.
Triggers	Click "DO" header → Change state of DO-list items to Normal (visible). Click "DON'T" header → Change state of DON'T-list items to Normal (visible).
States	DO/DON'T headers: Normal / Hover / Visited. List items: Hidden (initial) / Normal (revealed).
Feedback Messages	Not applicable (reference content).
Navigation	Standard Next/Back enabled.

Slide 11: How to Report a Phishing Email

Learning Objective	Objective 4 — Report phishing attempts correctly.
On-Screen	Reporting takes less than a minute. Click through the steps

Text	below. Step 1: Don't click, forward, or reply to the email. Step 2: Click the "Report Phishing" button in your email toolbar (or forward to security@yourcompany.com). Step 3: Delete the email once it's reported. Step 4: If you already clicked a link or entered information, tell IT Security immediately — you won't be in trouble for reporting quickly.
Narration Script	Reporting a phishing email takes less than a minute, and it protects everyone else in the company too. Here's exactly how to do it, step by step.
Visual Design	Horizontal 4-step process graphic (numbered circles connected by a thin teal line), off-white background. Each step's detail text appears in a callout box below the step marker on click. Step 4 styled slightly differently (gold outline) to signal it's a conditional "if this happened" step rather than a routine one.
Icons / Illustrations	Step 1: crossed-out cursor/click icon. Step 2: flag/report icon. Step 3: trash/delete icon. Step 4: phone/headset (IT Security contact) icon. • *Interaction Type** Sequential click-to-reveal (4 numbered markers).
Layers	4 layers, one per step, each a short callout with the step text (as drafted in On-Screen Text). • *Variables** None required.
Triggers	Click Step 1–4 marker → Show corresponding Layer, hide other layers. Marker state → Visited on click.
States	Each step marker: Normal / Hover / Visited.
Feedback Messages	Not applicable (procedural content).
Navigation	Standard Next/Back enabled.

Slide 12: Final Assessment

Learning Objective	All four course objectives — summative assessment.
On-Screen Text	You've made it to the final check. Answer 5–7 questions to complete this course. You need 80% or higher to pass. You can retake the assessment if needed. [Start Assessment] button
Narration Script	Time to put it all together. Answer the questions ahead as best you can — you'll need 80% to pass, and you're welcome to retake it if you need to.
Visual Design	Navy background matching the title slide, for visual bookending of the course. Off-white "Start Assessment" button, teal on hover. Small text line stating the passing score and retake policy for transparency.
Icons / Illustrations	Clipboard-with-checkmark icon.
Interaction Type**	Transition slide only — the actual questions are built as 5–7 separate native Storyline "Graded Question" slides immediately following this one (a mix of Multiple Choice and True/False question slide templates, inserted via Storyline's Question Slide feature). See Section 6 for the full question bank, correct answers, and feedback text for each.
Layers	Not applicable to this transition slide.
Variables**	Storyline's built-in quizzing feature automatically creates and manages the results variables (Results.ScorePercent, Results.PassFail, etc.) — no custom variables need to be created manually.
Triggers	Click "Start Assessment" → Jump to first graded question slide.
States	Button: Normal / Hover.
Feedback Messages	Not applicable on this slide (feedback is defined per question in Section 6).
Navigation	Standard Next/Back disabled on this slide; progression is only via the "Start Assessment" button, to make the transition into graded content deliberate.

Slide 13: Course Summary & Completion

Learning Objective	Reinforce all four objectives; provide a clean, deliberate close to the course.
On-Screen Text	Well done — here's a quick recap: ✓ Spotting phishing signs: sender, urgency, links, greetings ✓ Comparing real vs fake emails ✓ Choosing the safest action ✓ Reporting correctly, every time You scored [Results.ScorePercent]%. Thank you for helping keep our company secure. [Exit Course] button
Narration Script	Great work. You now know how to spot the signs, compare a real email to a fake one, choose the safest action, and report it properly. That one skill — pausing before you click — protects the whole organisation. Thanks for completing the course.
Visual Design	Off-white background with a clean four-item recap checklist (green checkmarks), mirroring the objectives layout from Slide 3 for a satisfying bookend. Learner's score displayed via a results reference text variable. A subtle congratulatory graphic (shield with checkmark) centred above the recap.
Icons / Illustrations	Shield-with-checkmark icon (course completion); four small icons matching each recap line, reused from earlier slides for consistency.
Interactions	None — summary/completion slide with a single Exit Course button.
Layers	Base layer only.
Variables	Displays the built-in Results.ScorePercent variable via a text reference (%Results.ScorePercent%) — no custom variable needed.
Triggers	Click "Exit Course" → Exit course (Storyline's built-in Exit Course trigger), consistent with how the other two Storyline

	portfolio projects (Google Classroom, Keep Your Cool) close out.
States	Exit Course button: Normal / Hover.
Feedback	Not applicable.
Messages	
Navigation	Next/Back hidden; "Exit Course" is the only exit point, consistent with the Welcome slide's single-entry-point design.

6. Final Assessment — Question Bank

Seven graded questions, built as native Storyline question slides (Multiple Choice and True/False templates) immediately following the transition slide (Slide 12). Passing score: 80% (must answer at least 6 of 7 correctly). Each question includes tailored feedback for both correct and incorrect responses, so the assessment continues to reinforce learning rather than simply scoring it.

Question 1 (Multiple Choice)

Tied to Objective	Objective 1 — Identify signs of phishing
Question Text	Which of the following is the strongest warning sign of a phishing email?
Option A	The email was sent in the morning
Option B	The sender's address is slightly different from the company's real domain ✓ Correct
Option C	The email includes an image
Option D	The email is longer than usual
Feedback — Correct	Correct! A mismatched or slightly altered sender domain is one of the clearest signs of phishing — always check the full address, not just the display name.
Feedback — Incorrect	Not quite. Time of day, images, and email length aren't reliable indicators. The strongest sign here is a sender address that doesn't quite match the real company domain.

Question 2 (True/False)

Tied to Objective	Objective 1 — Identify signs of phishing
Question Text	True or False: Phishing emails always contain obvious

	spelling and grammar mistakes.
Option A	True
Option B	False ✓ Correct
Feedback — Correct	Correct! Many phishing emails today are well-written and professional-looking. Don't rely on spelling errors alone — check the sender, links, and tone instead.
Feedback — Incorrect	Actually, this is false. Modern phishing emails are often well-written and error-free, so spelling mistakes are not a reliable way to detect them.

Question 3 (Multiple Choice)

Tied to Objective	Objective 2 — Distinguish legitimate vs phishing
Question Text	You receive an email from a colleague with a shared file link. What's the safest way to check if it's legitimate?
Option A	Click the link quickly before it expires
Option B	Hover over the link to preview the actual URL before clicking ✓ Correct
Option C	Reply to the email asking if it's real
Option D	Forward it to a friend to ask their opinion
Feedback — Correct	Correct! Hovering over a link (without clicking) shows you the real destination URL, which is one of the fastest ways to verify a link before trusting it.
Feedback — Incorrect	Not the safest option. Hovering over the link to preview its real destination — without clicking — is the safest first check.

Question 4 (True/False)

Tied to Objective	Objective 2 — Distinguish legitimate vs phishing
Question Text	True or False: An email can look completely professional and still be a phishing attempt.
Option A	True ✓ Correct
Option B	False
Feedback — Correct	Correct! Professional design and formatting say nothing about whether an email is legitimate — always check the

sender, links, and request itself.

**Feedback —
Incorrect**

This is actually true. Phishing emails are often designed to look highly professional, so appearance alone is not a reliable indicator.

Question 5 (Multiple Choice)

**Tied to
Objective**

Objective 3 — Decide the safest action

Question Text

You receive an urgent email asking you to reset your password immediately using a link in the email. What should you do?

Option A

Click the link right away since it's urgent

Option B

Ignore the email and do nothing

Option C

Go directly to the company portal yourself, without using the email's link ✓ Correct

Option D

Reply asking them to confirm it's legitimate

**Feedback —
Correct**

Correct! When in doubt, go directly to the trusted site yourself instead of clicking a link in the email — this avoids being redirected to a fake login page.

**Feedback —
Incorrect**

Not the safest choice. The safest action is to go directly to the company portal yourself, rather than clicking the email's link or replying to a potentially spoofed sender.

Question 6 (Multiple Choice)

**Tied to
Objective**

Objective 4 — Report phishing correctly

Question Text

What is the correct first step after you suspect an email is phishing?

Option A

Forward it to a coworker to see what they think

Option B

Reply to the sender asking them to stop

Option C

Use the "Report Phishing" button or forward it to the security reporting address, without clicking any links ✓ Correct

Option D

Delete it immediately without telling anyone

**Feedback —
Correct**

Correct! Reporting it — without clicking, replying, or forwarding it casually — helps IT Security protect the rest of

the organisation too.

**Feedback —
Incorrect**

Not quite. The correct step is to report it through the official channel (the Report Phishing button or security email address) without clicking any links first.

Question 7 (Scenario / Multiple Choice)

**Tied to
Objective**

Objectives 2, 3 & 4 — Applied decision-making

Question Text

You open an email that looks like it's from Finance, marked "URGENT: Invoice Overdue," with a generic greeting and a link to "resolve immediately." What should you do?

Option A

Click the link to see what it says, just in case it's real

Option B

Do not click the link; verify independently and report the email through the official channel ✓ Correct

Option C

Delete it and forget about it

Option D

Forward it to a few coworkers to warn them yourself

**Feedback —
Correct**

Correct! This has multiple phishing red flags — urgency, a generic greeting, and a suspicious link. The safest action is to avoid the link, verify independently, and report it properly.

**Feedback —
Incorrect**

Not the safest option. This email shows classic phishing signs. The correct response is to avoid clicking, verify independently, and report it through the official channel so Security can act on it.

End of Storyboard — Think Before You Click: Spotting Phishing Emails | Portfolio Project
